Statement

Thank you for choosing our Zmotion products. Please be sure to read this manual carefully before use so that you can use this product correctly and safely. Zmotion is not responsible for any direct or indirect losses caused by the use of this product.

The copyright of this manual belongs to Shenzhen Zmotion Technology Co., Ltd. And reproduction, translation, and plagiarism of any content in this manual in any form is strictly prohibited without the written permission of Zmotion.

The information in this manual is for reference only. Due to design improvements and other reasons, Zmotion reserves the right of final interpretation of this information! Contents are subject to change without prior notice!

Notes

In order to prevent possible harm and damage caused by incorrect use of this product, the following instructions are given on matters that must be observed.

Danger

Do not use it in places with water, corrosive or flammable gases, or near	
flammable substances.	May cause
When installing or disassembling, make sure the product is powered off.	electric
Cables should be connected securely, and exposed parts that are	shock, fire,
energized must be insulated by insulators.	damage,
Wiring work must be performed by professionals.	etc.

■ Notes

It should be installed within the specified environmental range.	
Make sure there are no foreign objects on the product hardware circuit	May aguas
board.	May cause
After installation, the product and the mounting bracket should be tight	damage, mis-
and firm.	
After installation, at least 2-3cm should be left between the product and	operation,
surrounding components for ventilation and replacement.	etc.
Never disassemble, modify, or repair it by yourself.

Chapter I Production Information

1.1. Product Information

ECI is the abbreviation of the network motion control card model launched by Zmotion Technology.

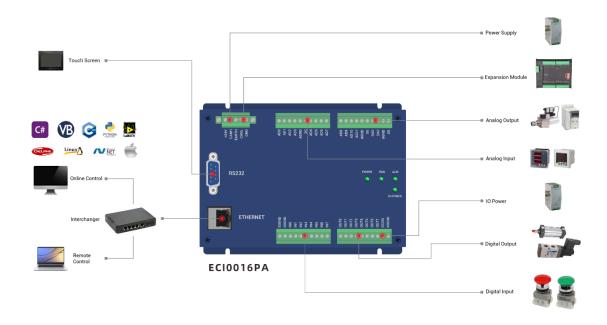

ECI0016PA is a kind of data capture card developed by Zmotion Technology. Realtime analog input capture and output control can be achieved through optimized network communication protocol.

ECI0016PA data capture card supports Ethernet and RS232 communication interface to connect to the computer. Every expansion module can be connected through CAN bus to expand inputs and outputs.

1.2. Function Features

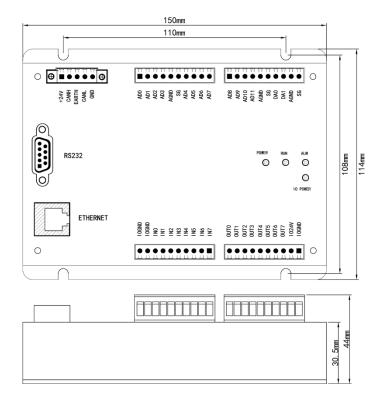

- Itself has 8 isolated inputs and 8 isolated outputs, NPN type, and they are powered by IO power supply.
- ◆ 272 inputs and 272 outputs can be extended through CAN bus.
- ◆ There are 12 ADs and 2 DAs, but 128 ADs and 64 DAs can be extended.
- ◆ The maximum output current of general digital outputs can reach 300mA, which can directly drive some kinds of solenoid valves.
- ◆ Interfaces: RS232, CAN, Ethernet.
- ◆ Support multi-file and multi-task programming in Basic.
- A variety of program encryption methods to protect the intellectual property rights of customers.

1.3. System Frame

1.4. Hardware Installment

ECI0016PA data capture card adopts the horizontal installation method of screw fixing, and each controller should be installed with 4 screws for fastening.

•	Non-professionals are strictly prohibited to operate. Specifically,
	professionals who had been trained related electrical equipment,
	or who master electrical knowledge.

- Please be sure to read the product instruction manual and safety precautions carefully before installation.
- Before installation, please ensure that the product is powered off.
- Do not disassemble the module, otherwise the machine may be damaged.
- Avoid direct sunlight installation.
- In order to facilitate ventilation and controller replacement, 2-3cm should be left between the upper and lower parts of the controller and the installation environment and surrounding components.
- Considering the convenient operation and maintenance of the controller, please do not install the controller in the following places:
 - a) places where the surrounding ambient temperature exceeds the range of -10°C-55°C
 - b) places where the ambient humidity exceeds the range of 10%-95% (non-condensing)
 - c) places with corrosive gases and flammable gases
 - d) places with many conductive powders such as dust and iron powder, oil mist, salt, and organic solvents

Installation attention

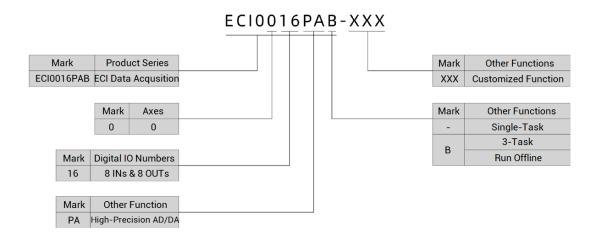

Chapter II Product Specification

2.1. Basic Specification

Item	Description	
Model	ECI0016PA	
Basic Axes	0	
Digital IO	8 inputs, 8 outputs.	
Max Extended IO	272 inputs, 272 outputs	
AD/DA	12 ADs, 2 DAs.	
Max Extended AD/DA	128 ADs, 64 DAs	
Array Space	800	
Program Space	3KByte	
Flash Space	128KByte	
Power Supply	24V DC input, IO power.	
Communication Interfaces	RS232, Ethernet, CAN.	
Digital output overcurrent	Max is 300mA.	
protection	IVIAX IS SOUTHA.	
Voltage impedance (input)	>1ΜΩ	
Voltage range (input)	Dual-pole ±10V (the range: -10V~10V)	
Voltage load (output)	2ΚΩ~1ΜΩ	
Voltage range (output)	Dual-pole ±10V (the range: -10V~10V)	
Analog resolution (input)	16-bit	
Analog resolution (output)	12-bit	
Capture time	2ms/channel	
Conversion time	1ms/channel	
Precision (common	10.1%	
temperature 25 °C)	±0.1%	
Precision (environmental	±0.3%	

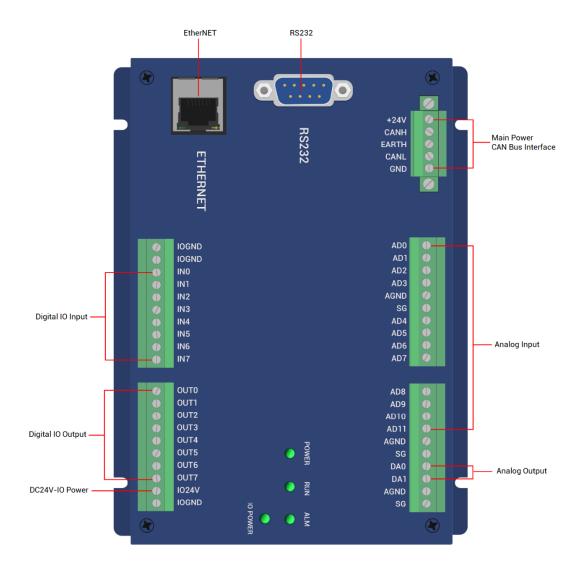

temperature 0~55 °C)	
Isolation	Between channel and switch power supply, isolated.
	Between channels, non-isolated.
Dimensions	150mm*144mm*30.5mm

2.2. Nameplate & Model

Model	Description		
ECI0016PA	8 inputs and 8 outputs (with overcurrent protection)		
ECI0016PAB 8 inputs and 8 outputs (with overcurrent protection), it can run or

ETHERNET			through interchanger, the number of net port

			channels can be checked through "?*port",
			default IP address id 192.168.0.11
+24V	Main power	1	24V DC power supplies for control card.
I024V	IO Power Supply	1	24V DC power supplies for IO power.
CAN	CAN CAN bus interface	1	Connect to CAN expansion module and CAN
CAN			equipment of other standards
IN	Digital IO input	8	NPN type, IO 24V supplies the power.
OUT	Digital IO output	8	NPN type, IO 24V supplies the power.
AD	Analog input	12	Resolution: 16-bit, -10V~10V
DA	Analog output	2	Resolution: 12-bit, -10V~10V

2.4. Work Environment

	Item	Parameters	
Work T	emperature	-10℃-55℃	
Work rela	ative Humidity	10%-95% non-condensing	
Storage	Temperature	-40°C ~ 80°C (not frozen)	
Storaç	ge Humidity	Below 90%RH (no frost)	
	Frequency	5-150Hz	
vibration	Displacement	3.5mm(directly install)(<9Hz)	
Vibration	Acceleration	1g(directly install)(>9Hz)	
	Direction	3 axial direction	
Shock (collide)		15g, 11ms, half sinusoid, 3 axial direction	
Degree of Protection		IP20	

Chapter III Wiring & Communication

3.1. Power Input, CAN Communication Interface

The power supply input adopts a 5Pin (there are all 5 terminals, +24V, CANH, EARTH, CANL and EGND) screw-type pluggable wiring terminal, and the interval (means the gap distance between two ports) should be 3.81mm. This 5Pin terminal is the power supply shared by control card and CAN communication.

→ Terminal Definition:

Terr	erminal Name Type		Function	
+24V	0	+24V	Input	Input for main power 24V
CANH	CANIH Input/C	Input/Output	CAN differential data +	
EARTH	0	EARTH	Grounding	Shield
CANL		CANL	Input/Output	CAN differential data -
GND		EGND	Input	Main Power Ground

Note:

Please separate internal power supply 24V from external IO power 24V, they cannot use the same power supply. Or use one power supply that can output two isolated 24V powers.

Terminal	Name	Туре	Function
I I024V	I024V	Input	IO power 24V input
IOGND	IOGND	Input	IO power ground

Note:

Please separate internal power supply 24V from external IO power 24V, they cannot use the same power supply. Or use one power supply that can output two isolated 24V powers.

3.1.1. Power Supply Specification

→ Specification for Main Power Supply

Item	Description	
Voltage	DC24V (-5%~5%)	
Current to open	≤0.5A	
Current to work	≤0.4A	
Anti-reverse connection	YES	
Overcurrent Protection	YES	

→ Specification for IO Power Supply

Item	Description	
Voltage	DC24V (-5%~5%)	
Current to open	≤0.15A	
Current to work	≤0.1A	
Anti-reverse connection	YES	
Overcurrent Protection	YES	

3.1.2. CAN Communication Specification & Wiring

The CAN interface of the control card adopts the standard CAN communication protocol, which mainly includes three ports, CANL, CANH and the public end. And it supports connecting CAN expansion modules and other standard CAN devices.

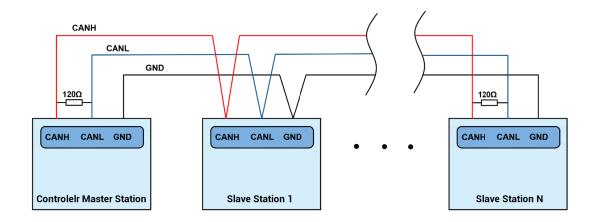

→ Specification

Item	Description	
Max Communication Rate (bps)	1Mbps	
Terminal Resistor	120Ω	

Topology	Daisy chain connection structure	
The number of nodes can be	Up to 16	
extended		
Communication Distance	The longer communication distance is, the lower	
Communication distance	communication rate is, max 30m is recommended.	

→ Wiring Reference

Connect the CANL and CANH of the standard CAN module to the CANL and CANH of the other side correspondingly. And public ends of the CAN bus communication both parties are connected to together. In CAN bus left and right sides, connect a 120Ω resistor respectively (please see below graphic).

→ Wiring Notes:

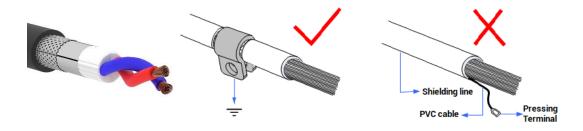

- As above, the daisy chain topology is used for wiring (the star topology structure cannot be used). When the use environment is ideal and there are no many nodes, the branch structure also can be used.
- Please connect a 120Ω terminal resistor in parallel to each end of the CAN bus for matching the circuit impedance and ensuring communication stability.
- Please be sure to connect the public ends of each node on the CAN bus to prevent the CAN chip from burning out.
- Please use STP (Shielded Twisted Pair), especially in bad environments, and make

sure the shielding layer is fully grounded.

- When on-site wiring, pay attention to make the distance between strong current and weak current, it is recommended for the distance to be more than 20cm.
- It should be noted that the equipment grounding (chassis) on the entire line must be good, and the grounding of the chassis should be connected to the standard factory ground pile.

→ Cable Requirements:

Shielded Twisted Pair, and the shielded cable is grounded.

3.1.2. Basic Usage Method

- (1) Please follow the above wiring instructions to wiring correctly.
- (2) After powered on, please use ETHERNET or RS232 to connect to RTSys.
- (3) Please use the "CANIO_ADDRESS" command to set the master's "address" and "speed" according to the needs, and use the "CANIO_ENABLE" command to enable or disable the internal CAN master function, or through "RTSys/Controller/State the Controller/Communication Info" to view the CAN status intuitively, and refer to the "Basic Programming Manual" for details.

CAN communication settings:
CANIO_ADDRESS = 32, CANIO_ENABLE = 1
ZCAN Master
CAN baud: 500KBPS
CAN enable: ON
Serial port configuration:
Port0:(RS232) is ModbusSlave Mode.
Address: 1, variable:2
Baud: 38400
DataBits:8
StopBits:1
Parity:0

- (4) Correctly set the "address" and "speed" of the slave station expansion module according to the manual of the slave station.
- (5) After all the settings are completed, restart the power supply of all stations to establish communication.
- (6) Note that the "speed" settings of each node on the CAN bus must be consistent, and the "address" settings cannot cause conflicts, otherwise the "ALM" alarm light will be on, and the communication establishment will fail or the communication will be disordered.

3.2. IN: Digital Input

The digital input adopts one 10Pin screw-type pluggable terminals, and the gap distance between terminals should be 3.81mm.

→ Wiring Definition

Termi	nal	Name	Туре	Function 1
	IOGND	IOGND	/	IO Public End
	IOGND	IOGND	/	IO Public Ellu
	IN0	IN0		Input 0
	IN1	IN1		Input 1
0	IN2	IN2	NPN type, low- speed input	Input 2
	IN3	IN3		Input 3
	IN4	IN4		Input 4
	IN5	IN5		Input 5
	IN6 IN7	IN6		Input 6
•	IIN 7	IN7		Input 7

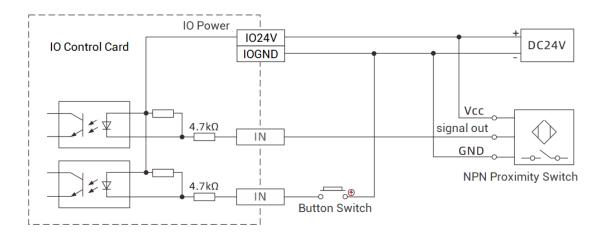

3.2.1. Digital Input Specification & Wiring

$\rightarrow \textbf{Specification}$

Item	Low-Speed Input (IN0-7)	
Input mode	NPN, the input is triggered by low-electric level	
Frequency	< 5kHz	
Impedance	4.7ΚΩ	
Voltage level	DC24V	
The voltage to open	<14.5V	
The voltage to close	>14.7V	
Minimal current	-1.8mA (negative)	
Maximum current	-6mA (negative)	
Isolation mode	optoelectronic isolation	

Note: the above parameters are standard values when the voltage of control card power supply (E+24V port) is 24V.

→ Wiring Reference

\rightarrow Wiring Note:

The wiring principle of low-speed digital input IN (0-7) is shown in the figure above.
 The external signal source can be an optocoupler, a key switch or a sensor, etc., all can be connected as long as the requirements on output of electric level can be achieved.

 For the public end, please connect the "EGND" port on the power supply to the "COM" terminal of the external input device. If the signal area power supply of the external device and the power supply of the controller are in the same power supply system, this connection also can be omitted.

3.2.2. Basic Usage Method

- (1) Please follow the above wiring instructions to wiring correctly.
- (2) After powered on, please select ETHERNET or RS232 to connect to RTSys.
- (3) State values of relative input ports can be read directly through "IN" command, also, it can be read through "RTSys/Tool/In". Please refer to "Basic" for details.

3.3.OUT: Digital Output

The digital output adopts one 10Pin screw-type pluggable terminals with a spacing of 3.81mm.

→ Wiring Definition

Termina	Name	Туре	Function 1
	OUT		Output 0
	UTO OUT		Output 1
	UT1 OUT:	:	Output 2
	UT2 UT3	NPN type, low-speed	Output 3
	UT4 OUT	output	Output 4
	UT5 OUT		Output 5
	UT6 UT7		Output 6
	017 024V OUT		Output 7
	OGND 1024	′ /	IO power input DC24V
	IOGN	/	IO power ground / IO public end

3.3.1. Digital Output Specification & Wiring

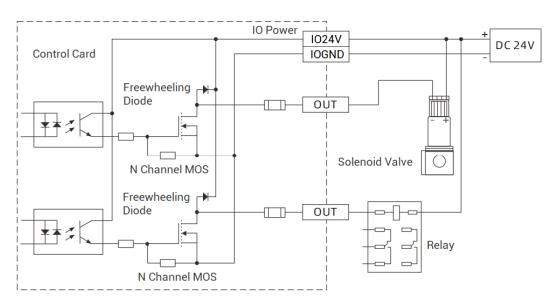

\rightarrow Specification

Item	Low Speed Output (OUT0-7)	
Output mode	NPN type, it is 0V when outputs	
Frequency	< 8kHz	
Voltage level	DC24V	
Max output current	+300mA	
Max leakage current when off	25μΑ	
Respond time to conduct	12µs	
Respond time to close	80µs	
Overcurrent protection	Support	
Isolation method	optoelectronic isolation	

Note:

- The times in the form are typical based on the resistive load, and may change when the load circuit changes.
- Due to the leak-type output, the shutdown of the output will be obviously affected by the external load circuit, and the output frequency should not be set too high in the application. For low-speed output, it is recommended to be lower than 8HKz. If there needs higher speed, please contact us to adjust parameter or custom hardware.

→ Wiring Reference

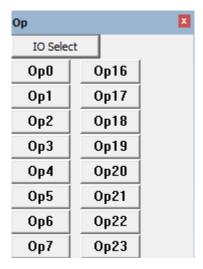

→ Wiring Note:

- The wiring principle of low-speed digital output OUT (0-7) is shown in the figure above. The external signal receiving end can be an optocoupler or a relay or solenoid valve, all can be connected as long as the input current does not exceed 300mA.
- For the connection of the public end, please connect the "EGND" port on the power supply to the negative pole of the DC power supply of the external input device. If the DC power supply of the external device and the controller power supply are in the same power supply system, this connection can also be omitted.

3.3.2. Basic Usage Method

- (1) Please follow the above wiring instructions to wiring correctly.
- (2) After powered on, please use ETHERNET or RS232 to connect to RTSys.
- (3) Open or close output port directly through "OP" command, also, it can be opened or closed through "RTSys/Tool/Op". Please refer to "Basic" for details.

3.4. AD/DA: Analog Input / Output

The analog terminal adopts 2 sets of 10Pin screw-type pluggable terminals with a spacing of 3.81mm.

$\rightarrow \text{Wiring Definition}$

Ter	minal	Name	Туре	Function 1
		AD0	Input	Analog input terminal AIN (0)
AD0	•	AD1	Input	Analog input terminal AIN (1)
AD1	•	AD2	Input	Analog input terminal AIN (2)
AD2 AD3	0	AD3	Input	Analog input terminal AIN (3)
AGND	0	AGND	Public end	Public end of this analog
SG	0	SG	/	Shield
AD4 AD5	0	AD4	Input	Analog input terminal AIN (4)
AD6	0	AD5	Input	Analog input terminal AIN (5)
AD7	AD7	AD6	Input	Analog input terminal AIN (6)
		AD7	Input	Analog input terminal AIN (7)
		AD	Input	Analog input terminal AIN (8)
AD8	•	AD	Input	Analog input terminal AIN (9)
AD9	0	AD	Input	Analog input terminal AIN (10)
AD10 AD11	0	AD	Input	Analog input terminal AIN (11)
AGND	0	AGND	Public end	Public end of this analog
SG	0	SG	/	Shield
DA0 DA1	0	DA0	Output	Analog output terminal AOUT (0)
AGND	•	DA1	Output	Analog output terminal AOUT (1)
SG	0	AGND	Public end	Public end of this analog
		SG	/	Shield

Note:

analog input supports single-ended input, and the reference ground of sensor needs to be connected to AGND terminal.

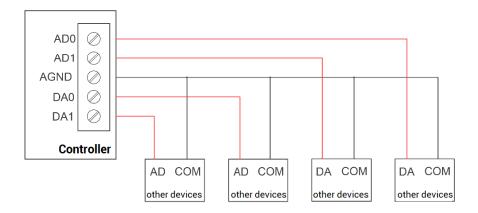

3.4.1. Analog Input / Output Specification & Wiring

$\rightarrow \textbf{Specification}$

Item	AD (0-11)	DA (0-1)
Resolution	16-bit	12-bit
Data range	0-65535	0-4095

Signal range	-10V-10V input	-10V-10V output
Data refresh	1kHz	1kHz
Voltage input impedance	>1MΩ (voltage input	>2KΩ (voltage output
/ output load	impedance)	load)

→ Wiring Reference

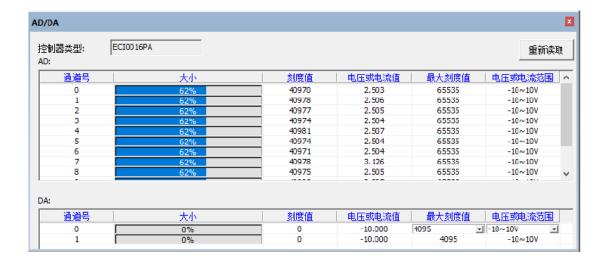

→ Wiring Note:

- The wiring principle of analog input / output is shown in the figure above, and external load signal range needs to be matched.
- Please use STP, especially when there is bad environment, make sure the shield is grounded fully.

3.4.2. Basic Usage Method

- (1) Please follow the above wiring instructions to wiring correctly.
- (2) After powered on, please use ETHERNET or RS232 to connect to RTSys.
- (3) Analog input voltage can be read through "AIN" command, and analog corresponding voltage can be output through "AOUT" command, also, it can through "RTSys/Tool/AD/DA". Please refer to "Basic" for details.

3.5. RS232 Serial Port

RS232 is in one standard DB9 male socket and supports MODBUS_RTU protocol and custom communication.

→ Interface Definition

Terminal	PIN	Name	Туре	Function	
	1, 4, 6, 7, 8	NC	Spare	Reserved	
	2	RXD	Input	RS232 signal, receive data	
5 9	3	TXD	Output	RS232 signal, send data	
1 6	5	FOND 0 1 1	Negative pole output of 5V power,		
	5	EGND	GND Output	Output	and output for the public end
	9		Positive pole output of 5V power,		
	9	+5V	Output	maximum is 300mA	

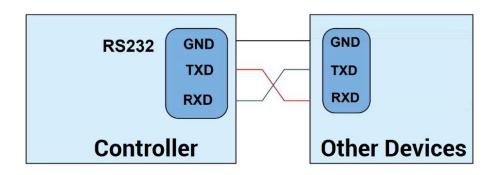

3.5.1. RS232 Interface Specification & Wiring

→ Specification:

Item	RS232
Maximum Communication Rate (bps)	115200

Terminal Resistor	No	
Topology Structure	Connect correspondingly (1 to 1)	
The number of nodes can be extended	1	
	The Longer communication distance is,	
Communication Distance	the lower communication rate is,	
	maximum 5m is recommended.	

→ Wiring Reference:

→ Wiring Notes:

- The wiring of RS232 is as above, it needs to cross-wiring for sending and receiving signals, and it is recommended to use a double-female head cross line when connecting to a computer.
- Please be sure to connect the public ends of each communication node to prevent the communication chip from burning out.
- Please use STP, especially in bad environments, and make sure the shielding layer is fully grounded.

3.5.2. Basic Usage Method

- (1) Please follow the above wiring instructions to wiring correctly.
- (2) After powered on, please use any ETHERNET or RS232 (there is default parameter,

which can be connected directly) to connect to RTSys.

- (3) Please use the "ADDRESS" and "SETCOM" commands to set and view the protocol station number and configured parameters, see "Basic Programming Manual" for details.
- (4) According to their respectively instructions, correctly set the relevant parameters of the third-party equipment to match the parameters of each node.
- (5) When all is configured, it can start to do communicating.
- (6) Communication data of RS232 can be directly viewed through "RTSys / Controller / State the Controller / CommunicationInfo".

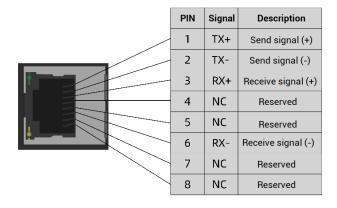

CAN communication settings:
CANIO_ADDRESS = 32, CANIO_ENABLE = 1
ZCAN Master
CAN baud: 500KBPS
CAN enable: ON
Serial port configuration:

Port0:(RS232) is ModbusSlave Mode. Address: 1, variable: 2

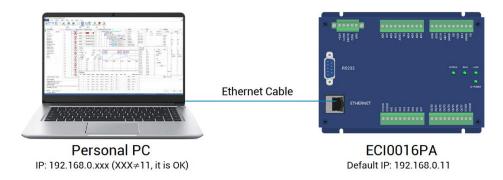

Baud:38400 DataBits:8 StopBits:1 Parity:0

3.6. ETHERNET

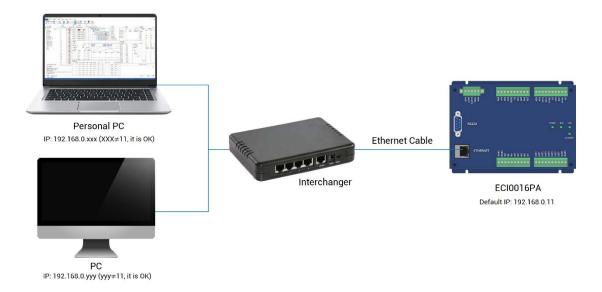

ECI0016PA data capture card has an Ethernet port, and it supports MODBUS_TCP protocol and custom communication, and the default IP address is 192.168.0.11. The pin definition is as follows:

The Ethernet port of the controller can be connected to a computer, HMI, etc. through an Ethernet cable, and using point to point connection method. The schematic diagram is as follows:

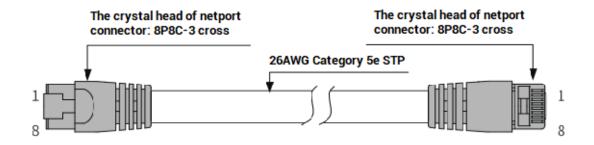

The controller can also be connected to the interchanger through an Ethernet cable, and then use interchanger to connect to other devices, then multi-point connection can be achieved. The schematic diagram is as follows:

→ Communication Cable Requirements

ETHERNET communication interface adopts standard Ethernet RJ45 interface.

The network cable adopts Category 5e STP, and the crystal head has a metal shell to reduce interference and to prevent information from being eavesdropped. As shown below:

Item	Specification
Cable type	Flexible crossover cable, Category 5e
traverse	twisted pair
Line pairs	4
Isolation	cross skeleton
Connector	Crystal head with iron shell
Cable material	PVC
Cable length	Less than 100m

Use RJ45 network cable connection method:

- When installing, hold the crystal head that is with the cable and insert it into the RJ45 interface until it makes a "click" sound (kada).
- In order to ensure the stability of communication, please fix the cables with cable ties.
- When disassembling, press the tail mechanism of the crystal head, and pull out the connector and the module in a horizontal direction.

Please use tube-type pre-insulated terminals and cables with appropriate wire diameters to connect the user terminals.

Chapter IV Expansion Module

The control card can expand digital IO and analogs AD/DA through CAN bus, ZIO series CAN bus expansion modules or ZMIO310-CAN series bus expansion modules can be selected. For details, please refer to corresponding user manuals.

4.1. Configure as CAN Expansion Module

4.1.1. ZCAN Slave Protocol Configuration

ECI0016PA is used as IO control card by default. When it is configured as the CAN bus slave station, ECI0016PA can be used as digital IO expansion module.

When ECI0016PA is used as ZIO expansion module, using CANIO_ADDRESS to configure CAN address and CAN communication speed. CAN ID addresses correspond to expanded IO number. For example, when CANIO_ADDRESS=1, IO Number of expanded ECI0016PA is 32. After CANIO_ADDRESS parameters modified, it is saved into FLASH automatically, and it will take effect after restart.

Below form shows CAN address and starting IO and AIO Number:

CAN Address	Starting IO No.	Starting AD No.	Starting DA No.
0	16	8	4
1	32	16	8
2	48	24	12
3	64	32	16
4	80	40	20
5	96	48	24
6	112	56	28
7	128	64	32
8	144	72	36
9	160	80	40
10	176	88	44
11	192	96	48
12	208	104	52
13	224	112	56

14	240	120	60
15	256	128	64

Firstly, check controller states to get the max IO No. and AIO No. of controller itself, then use CANIO_ADDRESS to configure. When IO/AIO No. of the card and IO/AIO No. of controller itself repeat, only one is valid. Therefore, it is recommended to configure CANIO_ADDRESS again to make them different.

ECI0016PA is as CAN communication master station by default, but when it is used as ZIO expansion module. If you need it is as CAN slave station, it is necessary to configure CAN address and communication ratio again. It can configure CANIO_ADDRESS parameter through online command.

According to CAN wiring, then after powered on, set DIP correctly, POWER, RUN and IO POWER are ON, ALM is off. At the same time, "Controller"—"State the Controller"—"ZCanNodes" in RTSys shows expansion module information and expanded IO No. range.

When multiple expansion modules are connected, DIP ID and corresponding resource No, reference are below:

Local	432-0(ZMC432)	32	30(0-29)	18(0-17)	0	2(0-1)
1	48(ZIO 1632)	0	16(32-47)	32(32-63)	0	0
3	26(ZIO 16082)	2	16(64-79)	8(64-71)	0	0
4	10(ZAIO0802)	0	0	0	8(40-47)	2(20-21)

ALMRM led is ON, please check the wiring, resistor or DIP setting, and whether controller is set as master station (CANIO_ADDRESS = 32 means main station, others are slave station.

Example:

CANIO_ADDRESS=1

'set CAN ID as 1, now is slave station, 500KBPS, used as ZCAN slave station.

CANIO_ADDRESS=2 + 256

'set CAN ID as 2, now is slave station, 250KBPS, used as ZCAN slave station.

CANIO_ADDRESS=3 + 512

'set CAN ID as 3, now is slave station, 125KBPS, used as ZCAN slave station.

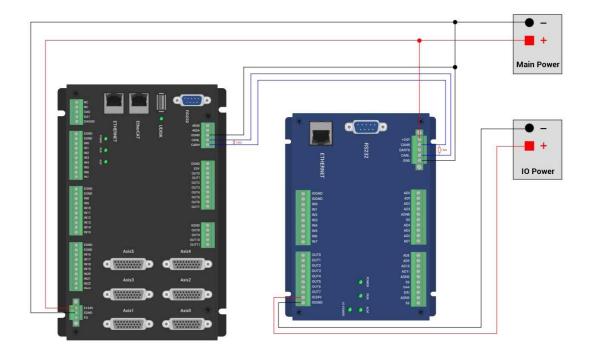

CANIO_ADDRESS=4 + 768

'set CAN ID as 4, now is slave station, 1MBPS, used as ZCAN slave station.

4.1.2. CAN Expansion & Main Station Wiring

ECI0016PA supports ZCAN protocol, connect to other controllers as ZIO expansion module through ZCAN protocol.

When it is ZIO expansion module, the wiring reference:

→ Wiring Note:

- When connecting multiple ZIO expansion modules on the CAN bus, a 120-ohm resistor needs to be connected in parallel between the CANL and CANH terminals. For the expansion module that has an 8-code DIP, terminal resistor is achieved by dialing the code.
- Please use STP to ensure communication quality and the shield layer is connected to ground. And please use the same power supply for internal powers of controller and expansion module.

4.1.3. IO Watch

The data acquisition card can operate IO, AD, and DA by using the input and output related instructions IN, OUT, AIN, and AOUT.

The analog input resolution of the data acquisition card is 16 bits, and the scale value range of the AIN command is $0\sim65535$. For example, the voltage input range of the data acquisition card is bipolar $\pm10V$, the scale value 0 corresponds to -10V, the scale value 32767 corresponds to 0V, and the scale value 65535 corresponds to 10V.

The analog output resolution of the data acquisition card is 12 bits, and the scale value range of the AOUT command is $0\sim4095$. For example, the voltage output range of the data acquisition card is bipolar $\pm10V$, the scale value 0 corresponds to -10V, the scale value 2047 corresponds to 0V, and the scale value 4095 corresponds to 10V.

Note: when watching the analogs, it is necessary to modify the scale value and the value of the voltage or current range in the "RTSys/Tool/AD/DA" interface.

Please refer to "BASIC Programming Manual" for details of the instructions.

4.2. CAN Bus Expansion

ZIO series expansion modules or ZMIO310-CAN coupler with sub modules can be used.

Connect control card to CAN bus expansion modules, when the eighth bit of the DIP switch of the expansion module is turned to ON, which indicates that a 120-ohm resistor has been connected, but needs to connect one 120-ohm resistor externally. When connecting multiple CAN expansion modules, you only need to dial ON for the eighth digit of the last expansion module, which means please do not dial bit-8 of other modules.

4.2.1. CAN Expansion Wiring

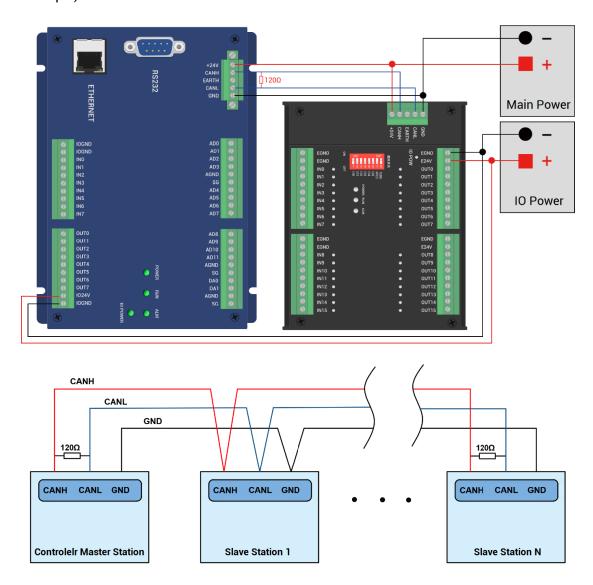

The ZIO expansion module is powered by the dual power supply. Except the main power supply, an additional IO power supply is required to supply independent power for IO. Both the main power supply and the IO power supply use 24V DC power supply. For ZAIO, it only needs to connect to the main power supply.

To prevent interference, separate the IO power supply from the main power supply.

Please select the expansion module according to the requirements, and select IO

mapping or axis mapping according to the resources of the expansion module.

Wiring reference of connection between ZIO expansion module and control card and standard wiring of CAN bus are shown as below (take ECI0016PA and ZIO1616 as the example):

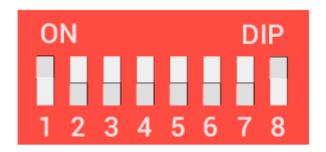

→ Wiring Note:

- ECI0016PA control card uses dual-power, and ZIO expansion module uses dual-power. When using, main power supply of expansion module and main power supply of controller can share one power. When they use different power supplies, controller power EGND needs to connect to expansion module power GND, otherwise CAN may be burnt out.
- When connecting multiple ZIO expansion modules on the CAN bus, a 120-ohm resistor needs to be connected in parallel between the CANL and CANH terminals, for

the ZIO expansion module that is with 8-digit dialing codes, the terminal resistor can be realized by dialing the code (DIP).

4.2.2. CAN Bus Expansion Resources Mapping

The ZCAN expansion module generally has an 8-bit DIP switch, dial ON to take effect, and the meaning of the DIP is as follows:

- 1-4: they are used for ZCAN expansion module IO address mapping, the corresponding value is 0-15.
- 5-6: CAN communication speed, corresponding value is 0-3, four different speeds are optional.
 - 7: reserved.
- 8: 120-ohm resistor, dial ON means a 120-ohm resistor is connected between CANL and CANH.

The IO numbers of the entire control system cannot be repeated, and existed numbers must be avoided when mapping resources. And the DIP switch must be dialed before power-on, if re-dial after power-on, it is invalid. It needs to be powered on again to take effect.

Dial 1-4 to select the CAN address, and the controller sets the IO number range of the corresponding expansion module according to the CAN DIP address. When each is dialed as OFF, the corresponding value is 0, when it is ON, it corresponds to a value of 1, and the address combination value = dial 4×8 + dial code 3×4 + dial code 2×2 + dial code 1.

Dial code 5-6 to select CAN bus communication speed, speed combination value=dial code 6×2 + dial code 5×1 , the combined value range is 0-3.

The corresponding speeds are as follows:

DIP 5-6 combination value	CANIO_ADDRESS high 8-bit value	CAN communication speed
0	0 (corresponds to decimal 128)	500KBPS (default value)
1	1 (corresponds to decimal 256)	250KBPS
2	2 (corresponding to decimal 512)	125KBPS
3	3 (corresponding to decimal 768)	1MBPS

The controller side sets the CAN communication speed through the CANIO_ADDRESS command. There are also four speed parameters that can be selected. The communication speed must be consistent with the communication speed of the expansion module that corresponds to the combination value, then they can communicate with each other.

The factory default communication speed is 500 KBPS on both sides, there is no need to set this, unless you need to change the speed.

The CANIO_ADDRESS command is a system parameter, and it can set the masterslave end of CAN communication. The default value of the controller is 32, that is, CANIO_ADDRESS=32 is the master end, and the slave end is set between 0-31.

The CAN communication configuration can be viewed in the "State the Controller" window.

→ IO Mapping:

the CAN expansion module uses bit1-4 of the DIP switch. According to the number of currently included IO points(the largest number in IN and OP must include IO point in the axis interface), use the bit 1-4 to set the ID, so as to determine the number range of IO to be expanded.

If the controller itself contains 28 INs and 16 OPs, then the starting address set by the first extended board should exceed the maximum value of 28. According to below rule, the dial code should be set to the combination value 1 (binary combination value 0001, from right to left, dial code 1-4, at this time dial 1 is set to ON, and the others are set to OFF), the IO number on the expansion board = the expansion board number value + the initial IO number value, among them, the IOs that are vacant from 29-31 Numbers are not used. Subsequent extended boards continue to confirm the dial settings according to the IO points in turn.

The initial digital IO mapping number starts from 16 and increases in multiples of 16. The distribution of digital IO numbers corresponding to different dial IDs is as follows:

DIP 1-4 combination value	Starting IO number	Ending IO number
0	16	31
1	32	47
2	48	63
3	64	79
4	80	95
5	96	111
6	112	127
7	128	143
8	144	159
9	160	175
10	176	191
11	192	207
12	208	223
13	224	239
14	240	255
15	256	271

The initial IO mapping number of the analog AD starts from 8 and increases in multiples of 8. The initial IO mapping number of the analog DA starts from 4 and increases in multiples of 4. The allocation of digital IO numbers corresponding to different dial code IDs is as follows:

DIP 1-4	Starting AD	End AD	Starting DA	End DA
combination value	number	number	number	number
0	8	15	4	7
1	16	23	8	11
2	24	31	12	15
3	32	39	16	19
4	40	47	20	23
5	48	55	24	27
6	56	63	28	31
7	64	71	32	35

8	72	79	36	39
9	80	87	40	43
10	88	95	44	47
11	96	103	48	51
12	104	111	52	55
13	112	119	56	59
14	120	127	60	63
15	128	135	64	67

→ Expansion Resources Checking:

According to CAN wiring, after powered on, and all resistor codes were set correctly, POWER, RUN and IO POWER should be ON, ALM is OFF. At the same time, it shows expansion module information and expanded IO range number in "RTSys/Controller/State the controller/ZCanNodes".

When connecting multiple expansion modules, DIP ID and corresponding resources No. are below:

Local	432-0(ZMC432)	32	30(0-29)	18(0-17)	0	2(0-1)
1	48(ZIO 1632)	0	16(32-47)	32(32-63)	0	0
3	26(ZIO 16082)	2	16(64-79)	8(64-71)	0	0
4	10(ZAIO0802)	0	0	0	8(40-47)	2(20-21)

If ALMRM led is ON, please check wiring, resistor, DIP setting, CANIO_ADDRESS setting (should be 32 master station) and CAN communication speed.

Chapter V Programming

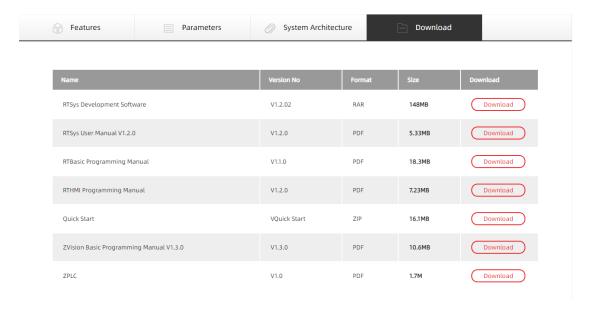

5.1. Program in RTSys Software

RTSys is a PC-side program development, debugging and diagnostic software for the Zmotion motion controllers. Through it, users can easily edit and configure the controller program, quickly develop applications, diagnose system operating parameters in real time, and debug the running program in real time. What's more, it supports Chinese and English bilingual environments.

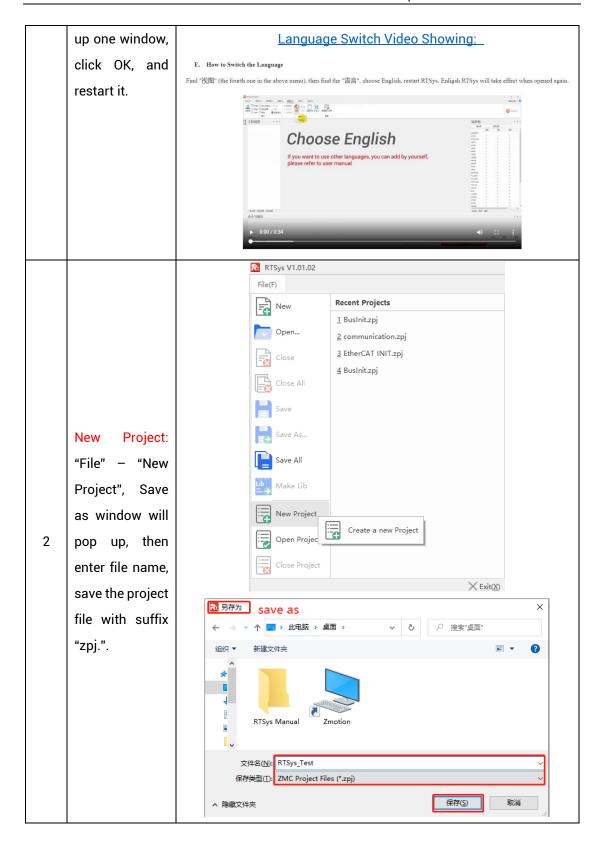

In RTSys, there are 4 programming languages for motion control development, Basic, PLC, HMI and C language, they can run multi-tasks among them, especially for Basic, multi-task running can be achieved separately, hybrid programming is also OK with PLC, HMI and C language.

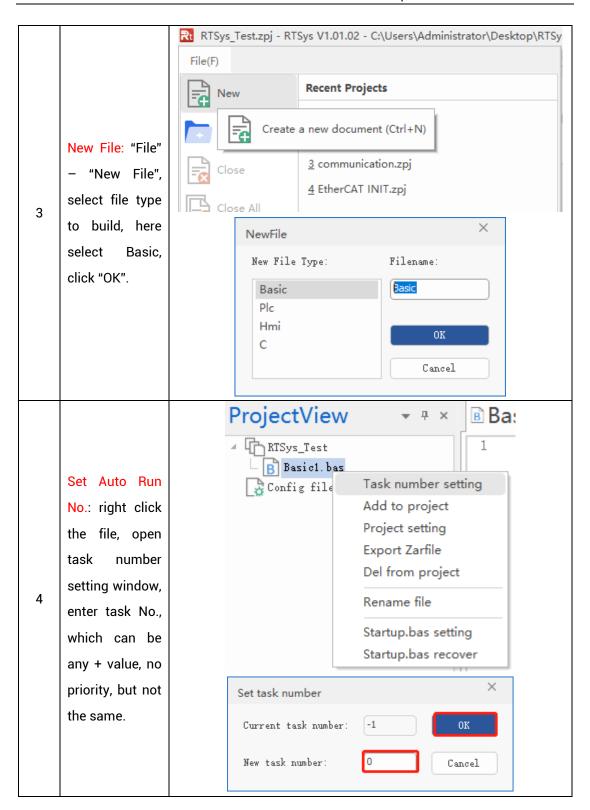

RTSys Downloading Address: https://www.zmotionglobal.com/pro_info_282.html

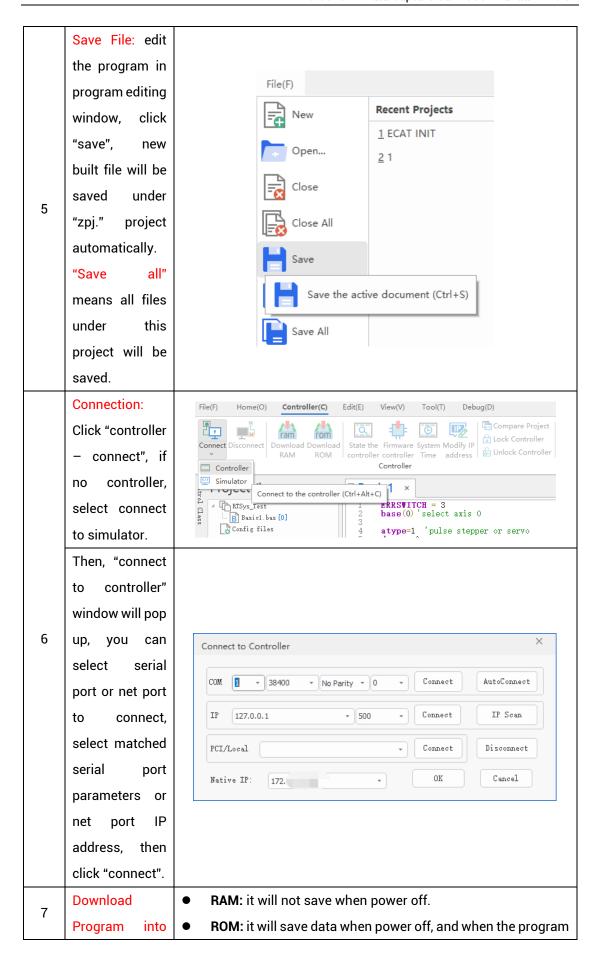

And related manuals can be found in "Download":

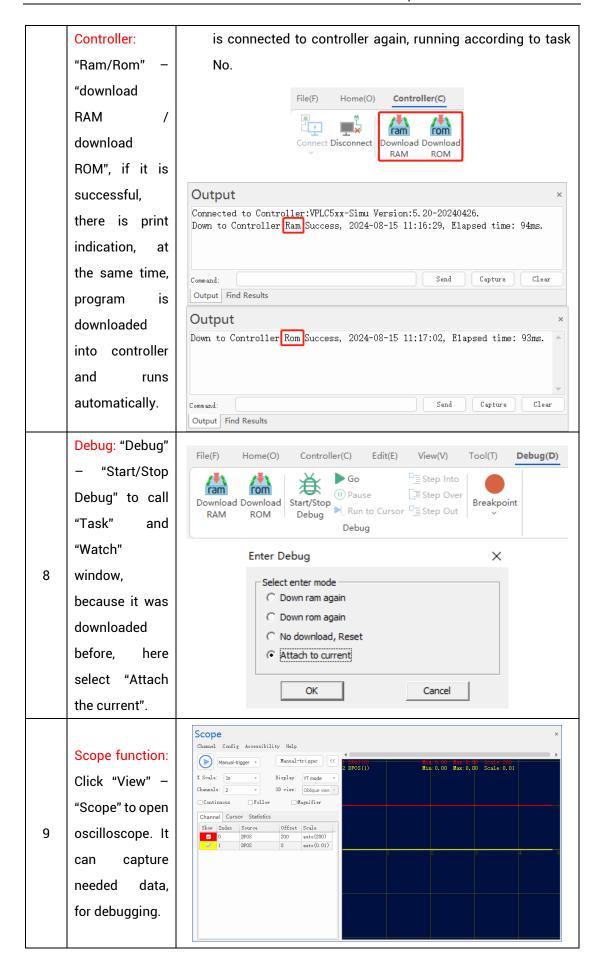

Step	Operations	Display Interface
1	Switch the Language: "Language" - "English", then there will pop	Language Font Theme Custor Style Simplified Chinese English

Notes:

- When opening an project, choose to open the zpj file of the project. If only the Bas file
 is opened, the program cannot be downloaded to the controller.
- When the project is not created, only the Bas file cannot be downloaded to the controller.
- The number 0 in automatic operation represents the task number, and the program runs with task 0, and the task number has no priority.
- If no task number is set for the files in the entire project, when downloading to the controller, the system prompts the following message WARN: no program set autorun

5.2. Upgrade Controller Firmware

Firmware upgrade can be achieved by downloading zfm firmware package in RTSys. zfm file is the firmware upgrade package of controller, please select corresponding firmware because different models are with different packages, please contact manufacturer).

How to update:

- a. Open <u>ZDevelop</u> / <u>RTSys</u> software, then click "controller connect", find PCI/LOCAL method, click "connect". If connected, there will be "Connected to Controller: PCIE464 Version: 4.93 20231220." In "output" window.
- b. Click "controller state the controller", find basic info, then current software version can be checked.
- c. Click "controller update firmware", current controller model and software version can be viewed.
- d. Click "browse", and select saved firmware file, click "update", then one window will pop up, please click "ok".
- e. After that, "connect to controller" window appears again, and please select "PCI/Local" again, and click "connect".
- f. When connection is successful, "firmware update" interface is shown. Now

system enters ZBIOS state, please click "update" again.

- g. When it is loaded, "firmware update" window disappears, now in output window, it shows "Update firmware to Controller Success".
- h. Do step a and step b again, check whether the firmware is updated or not.

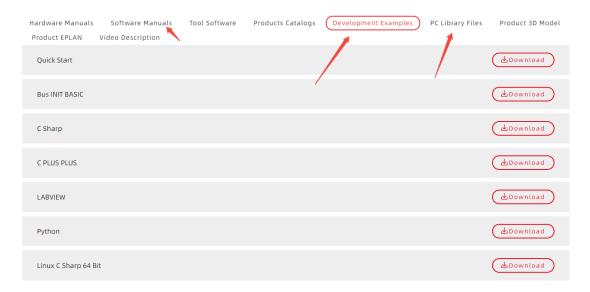

5.3. Program in Host-Computer by PC Languages

The controller supports development under various operating systems such as windows, linux, Mac, Android, and wince, and provides dll libraries in various environments such as vc, c#, vb.net, and labview, as shown in the figure below. PC software programming refers to "Zmotion PC Function Library Programming Manual".

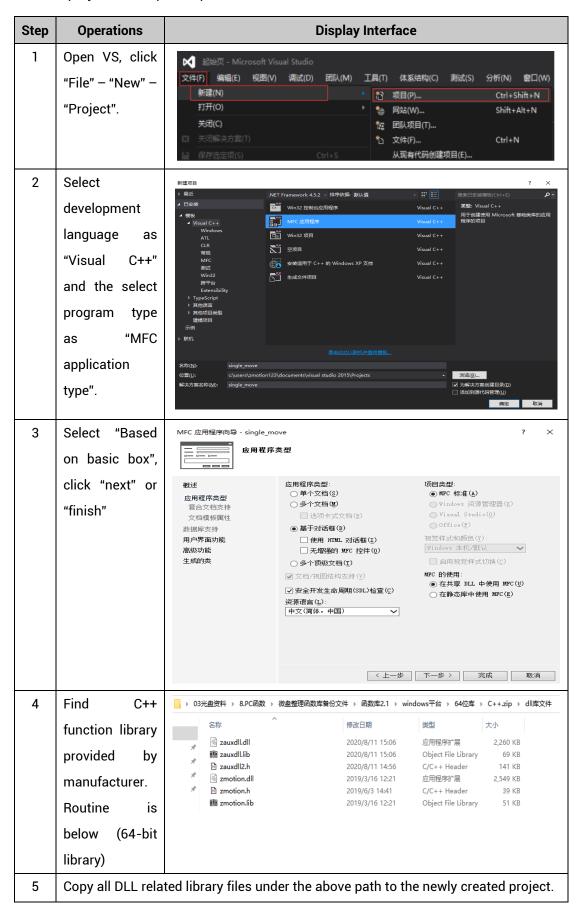

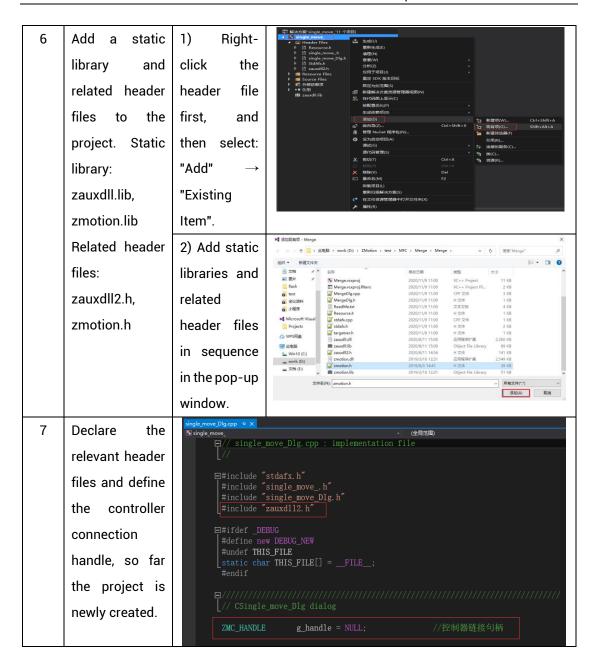

The program developed using the PC software cannot be downloaded to the controller, and it is connected to the controller through the dll dynamic library. The dll library needs to be added to the header file and declared during development.

Get PC library file, example: https://www.zmotionglobal.com/download_list_17.html

The c++ project development process in VS is as follows:

Chapter VI Operation and Maintain

The correct operation and maintenance of the device can not only guarantee and extend the life cycle of the equipment itself, but also take technical management measures according to the pre-specified plan or the corresponding technical conditions to prevent equipment performance degradation or reduce the probability of equipment failure.

6.1. Regular Inspection and Maintenance

The working environment has an impact on the device. Therefore, it is usually inspected regularly based on the inspection cycle of 6 months to 1 year. The inspection cycle of the device can be appropriately adjusted according to the surrounding environment to make it work within the specified standard environment.

Check item	Check content	Inspection standards
power supply	Check whether the voltage is rated	DC 24V (-5%~5%)
	Whether the ambient temperature is within the specified range (when installed in the cabinet, the temperature inside the cabinet is the ambient temperature)	-10°C - 55°C
surroundings	Whether the ambient humidity is within the specified range (when installed in the cabinet, the humidity in the cabinet is the ambient humidity)	10%-95% non-condensing
	Is there direct sunlight	No
	With or without droplets of water, oil, chemicals, etc.	No
	Whether there is dust, salt, iron filings, dirt	No
	Whether there is corrosive gas	No
	Whether there are flammable and	No

	explosive gases or articles		
	Whether the device is subjected to vibration or shock	Should be within the range of vibration resistance and impact resistance	
	Is the heat dissipation good	Keep good ventilation and heat dissipation	
	Whether the basic unit and the expansion unit are installed firmly	The mounting screws should be tightened without loosening	
Installation and Wiring Status	Whether the connecting cables of the basic unit and the expansion unit are fully inserted	The connection cable cannot be loosened	
	Are the screws of the external wiring loose	Screws should be tightened without loosening	
	Whether the cable is damaged, aged, cracked	The cable must not have any abnormal appearance	

6.2. Common Problems & Solutions

Problems	Suggestions
	1. Check whether the ATYPE of the controller is correct.
	2. Check whether hardware position limit, software
	position limit, alarm signal work, and whether axis
	states are normal.
	3. Check whether motor is enabled successfully.
	4. Confirm whether pulse amount UNITS and speed
Mater deservet retate	values are suitable. If there is the encoder feedback,
Motor does not rotate.	check whether MPOS changes.
	5. Check whether pulse mode and pulse mode of drive
	are matched.
	6. Check whether alarm is produced on motion
	controller station or drive station.
	7. Check whether the wiring is correct.
	8. Confirm whether controller sends pulses normally.

The position limit signal is invalid. The position limit signal is invalid. The position limit signal is invalid. 2. Check whether the mapping of the limit switch is correct. 3. Check whether the limit sensor is connected to the common terminal of the controller. 1. Check whether the limit sensor is working normally, and whether the limit sensor is working normally, and whether the limit sensor is working normally, and whether the limit sensor. 2. Check whether the mapping of the limit switch is correct. 3. Check whether the mapping of the limit switch is correct. 4. Check whether the limit sensor is connected to the common terminal of the controller. The output does not work. 1. Check whether IO power is needed. 2. Check whether ID power is needed. 2. Check whether the output number matches the ID of the IO board. 1. Check whether the power of the power supply is sufficient. At this time, it is best to supply power to the controller alone, and restart the controller after adjustment. 2. Check whether the ALM light flickers regularly (hardware problem). RUN led is ON, ALM led is ON. 1. Program running error, please check RTSys error code, and check application program. 1. Check whether the serial port parameters are modified by the running program, you can check all the current serial port configurations through ?*SETCOM.			
Check whether the mapping of the limit switch is correct. Check whether the limit sensor is connected to the common terminal of the controller. cannot be connected. whether the 120 ohm resistor is installed at both	cannot be connected.		whether the 120 ohm resistor is installed at both

		ends.
	2.	Check the master-slave configuration,
		communication speed configuration, etc.
	3.	Check the DIP switch to see if there are multiple
		expansion modules with the same ID.
	4.	Use twisted-pair cables, ground the shielding layer,
		and use dual power supplies for severe interference
		(the main power supply of the expansion module and
		the IO power supply are separately powered)
	1.	Check IP address of PC, it needs to be at the same
		segment with controller IP address.
	2.	Check controller IP address, it can be checked and
		captured after connection through serial port.
	3.	When net port led is off, please check wiring.
	4.	Check whether controller power led POWER and
		running indicator led RUN are ON normally.
	5.	Check whether the cable is good quality, change one
		better cable to try again.
Fail to connect controller	6.	Check whether controller IP conflicts with other
to PC through net port.		devices.
to Fo tillough het port.	7.	Check whether controller net port channel ETH are all
		occupied by other devices, disconnect to other
		devices, then try again.
	8.	When there are multiple net cards, don't use other net
		cards, or change one computer to connect again.
	9.	Check PC firewall setting.
	10.	Use "Packet Internet Groper" tool (Ping), check
		whether controller can be Ping, if it can't, please
		check physical interface or net cable.
	11.	Check IP address and MAC address through arp-a.
